

TITLE of the INVENTION

"Method and device for configuring an electronic document processing peripheral
in a communication network"

TEXT of the ABSTRACT

The invention concerns a method and device for configuring an electronic document processing peripheral. The invention concerns more particularly a method of determining a configuration profile for an electronic document processing peripheral, the configuration profile representing a set of configuration parameters for the peripheral, a set of fixed values of the parameters defining a particular configuration of the peripheral. This method is characterised in that it comprises the following steps: a step of obtaining (504) a user identification data item; a step of determining (506) user characteristics as a function of the user identification data item; a step of determining (508), as a function of the user characteristics, a configuration profile applicable for configuring the peripheral.
